

Melamine & Polyester

0.3mm to 0.4mm

Hot-air application

Hot-melt application

Introduction to Melamine & Polyester

This traditional type of edgebanding is produced by impregnating plain or printed paper with resin - which gives it rigidity.

Available in a variety of widths and a multitude of colours.

It can be supplied either un-glued for use with hot melt edgebanders or pre-glued for use with hot air reactivation machines or even the trusty iron.

Melamine

Standard Melamine is a paper based single layer material available from NEY in an attractive range of stock colours at very competitive prices.

Polyester

Polyester meets all of the highest specifications of paper based materials including resistance against most acids. It is flexible, non-toxic when incinerated and also offers a very attractive range of colours.

Customised packaging options available

Our Melamine & Polyester range of materials are available:
